	 <pre> graph TD     Start([Start]) --&gt; ReadDict[Read in one segment of the phrase dictionary]     ReadDict --&gt; SetArray[Set up an array containing up to six component concepts for a given phrase]     SetArray --&gt; SetK[Set k = 1]     SetK --&gt; Match{Does the kth component in the array match any of the concepts attached to the present text word?}     Match -- No --&gt; SetKplus[Set k equal to k + 1]     Match -- Yes --&gt; IncWeight[Increment the weight count for the phrase]     SetKplus --&gt; Empty{Is the input array empty?}     Empty -- No --&gt; SetK     Empty -- Yes --&gt; NextWord{Is the next text word in the same sentence?}     NextWord -- No --&gt; CalcFreq[Calculate frequency of phrase in present sentence and add it to frequency count of this phrase on output list]     NextWord -- Yes --&gt; IncWeight     CalcFreq --&gt; EndDoc{Have we reached the end of the present document?}     EndDoc -- No --&gt; ClearCounters[Clear the frequency counters in input array]     ClearCounters --&gt; SetK     EndDoc -- Yes --&gt; FoundDoc{Was the present phrase found in this document?}     FoundDoc -- No --&gt; MorePhrasesCore{Are there more phrases in core?}     FoundDoc -- Yes --&gt; MoveOutput[Move phrase to output list]     MorePhrasesCore -- No --&gt; MorePhrasesTape{Are there more phrases on tape?}     MorePhrasesCore -- Yes --&gt; IncWeight     MorePhrasesTape -- No --&gt; Exit([Exit])     MorePhrasesTape -- Yes --&gt; IncWeight     MoveOutput --&gt; SetK     </pre> <p><b>Fig. 3-19</b> Statistical phrase detection.</p>		<p>website files. These specific files selected and viewed by the user are recorded by the affinity server.”</p> <p>Belkin p. 402 “The overall structure of the system is based on blackboard architecture, a collection of independent cooperating experts which communicate indirectly using a shared global data structure. The I<sup>3</sup>R system can be compared to the Hearsay-II system. Hearsay-II is a speech understanding system that synthesizes the partial interpretations of several diverse knowledge sources into a coherent understanding of a spoken sentence. [21] Knowledge sources communicate by reading and writing on a blackboard. The blackboard has several distinct levels which hold different representations of the problem space.” [Similar to the speech understanding system, I<sup>3</sup>R takes data provided by the user, which can include sentences, and later uses the information.]</p> <p>Belkin p. 403 “For I<sup>3</sup>R to be adaptable, it must be able to assess the user’s abilities so it can adjust the interface to match them.[22].”</p>

The '067 Patent	Salton 68	Culliss	Additional Prior Art References
			<p>Salton 1989, p. 405-6 “To help furnish semantic interpretations outside specialized or restricted environments, the existence of a <i>knowledge base</i> is often postulated. Such a knowledge base classifies the principal entities or concepts of interest and specifies certain relationships between the entities. [43-45]. . . . The literature includes a wide variety of different knowledge representations . . . [one of the] best-known knowledge-representation techniques [is] the <i>semantic-net</i>. . . . In generating a semantic network, it is necessary to decide on a method of representation for each entity, and to relate or characterize the entities. The following types of knowledge representations are recognized: [46-48]. . . . A linguistic level in which the elements are language specific and the links represent arbitrary relationships between concepts that exist in the area under consideration.”</p> <p>Herz 27:62-67 “In a variation, each user’s user profile is subdivided into a set of long-term attributes, such as demographic characteristics, and a set of short-term attributes . . . such as the user’s textual and multiple-choice</p>

The '067 Patent	Salton 68	Culliss	Additional Prior Art References
			<p>answers to questions.”</p> <p>Herz 56:20-28 “As in any application involving search profiles, they can be initially determined for a new user (or explicitly altered by an existing user) by any of a number of procedures, including the following preferred methods: . . . (2) using copies of the profiles of target objects or target clusters that the user indicates are representative of his or her interest.”</p> <p>Herz <i>See also</i> Abstract; 1:18-43; 4:49–8:8; 28:41–55:42; 55:44–56:14; 56:15-30; 58:57–60:9; Figs. 1-16.</p>
(b) generating, by the computer system, an empty user data profile;	See Salton 1968 p. 414 (Fig. 10-4)	Culliss 3:46-48 “Inferring Personal Data. Users can explicitly specify their own personal data, or it can be inferred from a history of their search requests or article viewing habits. In this respect, certain key words or terms, such as those relating to sports (i.e. “football” and “soccer”), can be detected within search requests and used to classify the user as someone interested in sports.”	<p>Chislenko 3:38-39 “Each user profile associates items with the ratings given to those items by the user. Each user profile may also store information in addition to the user’s ratings.”</p> <p>Chislenko 4:15-18 “For example, the system may assume that Web sites for which the user has created “bookmarks” are liked by that user and may use those sites as initial entries in the user’s profile.”</p>

The '067 Patent	Salton 68	Culliss	Additional Prior Art References
			<p>Chislenko 4:40-50 "Ratings can be inferred by the system from the user's usage pattern. For example, the system may monitor how long the user views a particular Web page and store in that user's profile an indication that the user likes the page, assuming that the longer the user views the page, the more the user likes the page. Alternatively, a system may monitor the user's actions to determine a rating of a particular item for the user. For example, the system may infer that a user likes an item which the user mails to many people and enter in the user's profile and indication that the user likes that item."</p> <p>Dedrick <i>See, e.g.</i>, 3:37-4:9, 5:34-6:3, 6:53-8:19, 14:65-15:10, Abstract, Figures 1-8.</p> <p>Kurtzman, II Abstract "Content stream analysis is a user profiling technique that generates a user profile based on the content files selected and viewed by a user. This user profile can then used to help select an advertisement or other media presentation to be shown to the user."</p> <p>Kurtzman, II <i>See, e.g.</i>, 3:45-50.</p> <p>Belkin p. 403 "For I<sup>3</sup>R to be</p>

The '067 Patent	Salton 68	Culliss	Additional Prior Art References
			<p>adaptable. it must be able to assess the user's abilities so it can adjust the interface to match them.[22] This requires a user model builder. As each user may have his own view of the subject area being searched. it would be valuable to capture this information and remember it from session to session in a domain knowledge expert."</p> <p>Herz 56:20-31 teaches that user profiles should be created for "new users," 27:49-51, and specifies how user search profiles can be "initially determined."</p> <p>Herz <i>See also</i> Abstract; 1:18-43; 27:47-49; 27:62-67; 4:49-8:8; 28:41-55:42; 55:44-56:14; 56:15-30; 58:57-60:9; Figures 1-16.</p>
(c) retrieving, by the computer system, a text item from said user linguistic data;	Salton teaches retrieving locating multiple text items. See Salton 1968, p. 96 (Fig. 3-19) ("Are there more phrases on [magnetic storage] tape"), above.	Culliss 3:46-48 "Inferring Personal Data. Users can explicitly specify their own personal data, or it can be inferred from a history of their search requests or article viewing habits. In this respect, certain key words or terms, such as those relating to sports (i.e. "football" and "soccer"), can be detected within search requests and used to classify the user as someone interested in sports."	<p>Braden 7:47-49 "each of the documents in the set is subjected to natural language processing, specifically morphological, syntactic and logical form, to produce logical forms for each sentence in that document."</p> <p>Braden Abstract "Apparatus and accompanying methods for an information retrieval system that utilizes natural language processing to process results</p>

The '067 Patent	Salton 68	Culliss	Additional Prior Art References
			<p>retrieved by, for example, an information retrieval engine such as a conventional statistical-based search engine, in order to improve overall precision. Specifically, such a search ultimately yields a set of retrieved documents. Each such document is then subjected to natural language processing to produce a set of logical forms.”</p> <p>Braden <i>See, e.g.</i>, 11:62-14:61.</p> <p>Chislenko 4:15-18 “For example, the system may assume that Web sites for which the user has created “bookmarks” are liked by that user and may use those sites as initial entries in the user’s profile.”</p> <p>Chislenko 4:40-50 “Ratings can be inferred by the system from the user’s usage pattern. For example, the system may monitor how long the user views a particular Web page and store in that user’s profile an indication that the user likes the page, assuming that the longer the user views the page, the more the user likes the page. Alternatively, a system may monitor the user’s actions to determine a rating of a particular item for the user. For example, the system may infer that a user likes an item which the user mails</p>
